## Introduction

- Artificial Neural Networks (ANNs) are good at recognizing patterns, but they follow rules that are not biologically plausible.
- A standard learning rule used in machine learning is backpropagation, which uses gradient descent. It follows the weight update rule:

$$\Delta W \sim \frac{\partial Error}{\partial W} \sim \frac{\partial Error}{\partial A_{post}} \times A_{pre}$$

- This is not biologically plausible since it uses **nonlocal error**.
- We hypothesize that separate soma and dendrite compartments can be used to compute local error<sup>1,2,3</sup>. Learning rules based on this were then compared to backprop as a benchmark on a non-linear classification task.
- We first tested this idea in our "dendritic temporal contrast"<sup>4</sup> model:

$$N \sim D_B - D_F$$
;  $\Delta W \sim N \times A_{pre}$   
 $A_{post} \leftarrow A_{post} + N$ 

- This model compares top-down input before and after a teaching signal (nudge) is applied.
- We extended this further by using interneurons. Here, a comparison is made between top-down input and lateral current input to dendrites:

$$N \sim D_B = I_{TD} - I_{Int}; \ \Delta W \sim N \times A_{pre}$$

2 Neurons

### Legend:

W: Weights (synaptic strength) A: Activity (firing rate of neuron) N: Nudge (teaching signal)

D: Dendritic state B: Backward pass

 $I_{TD}$ : Top-Down Input  $I_{Int}$ : Interneuron Input *F*: Forward pass

# Conclusions

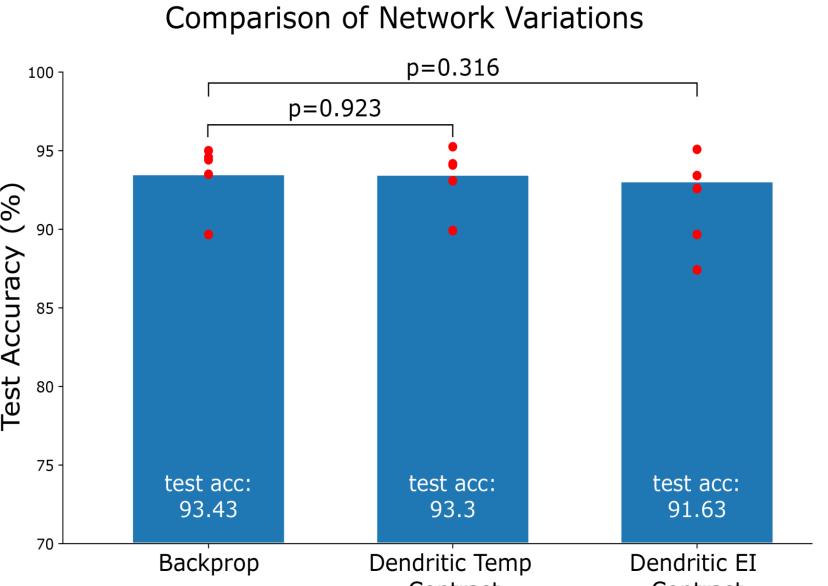

Fig 4: Comparison of validation accuracies for 3

ANNs, with p-values in comparison to Backprop

- Contrast **Model Variations**
- Compartmentalizing neurons into dendrites and somas to pass error signals can be used to approximate backprop in a biologically plausible way.
- Dendrite-targeting interneurons effectively separate self-generated signals from true error signals, to accurately approximate the gradient.

#### **Future Directions**

- Learn top-down weights on the backward pass instead of using the transpose matrix.
- 2. Use separate excitatory and inhibitory neurons to make network more biologically plausible.
